COMP5047

Assessment cover

Applied Software Eng

Module 140.	COM 5047	Woddie title.	Applied Software Eng	
Assessment title:	C-C	- C A1:+:		
Assessment title:	Software Engineering of a Modern Computer Application			
			_	
Due date and time:	23:00pm, 5th Dec. 2025			
		84 hours per student		
Cationated total time	to be exent an assignment.			
Estimated total time	to be spent on assignment:			

Module title:

LEARNING OUTCOMES

Module No.

On successful completion of this assignment,	students will be	able to ac	hieve the I	nodule's
following learning outcomes (LOs):				

- 1. Demonstrate an understanding of the role of requirements analysis and specification in software engineering and to be able to use this knowledge to create use case models and functional models of computer applications.
- Demonstrate an understanding of the relationship between requirements and design and to be able to apply the knowledge to create structural and behavioural models of computer applications.
- Critically evaluate and utilise design paradigms of object-oriented analysis and design, component-based design, and service-oriented design.
- Use software modelling language such as UML and modelling tools in the context of model-driven software engineering.
- Work in a group to apply the knowledge and skills developed in this module

Engi	Engineering Council AHEP4 LOs assessed				
C3	Select and apply appropriate computational and analytical techniques to model complex problems, recognising the limitations of the techniques employed				
C5	Design solutions for complex problems that meet a combination of societal, user, business and customer needs as appropriate. This will involve consideration of applicable health & safety, diversity, inclusion, cultural, societal, environmental and commercial matters, codes of practice and industry standards				
C6	Apply an integrated or systems approach to the solution of complex problems				
C14	Discuss the role of quality management systems and continuous improvement in the context of complex				

C16		y as an individual, and as a member or leader of	a team

RUBRIC OR EQUIVALENT:

APPENDIX I.

Introduction

This piece of work covers the practical application of some of the principles of software engineering as part of the course COMP5047 - Applied Software Engineering, and the aim of this coursework is to document the project management structure and software quality requirements of the "Society Leader App", which is part of the larger United Student Unions system. The document in fact provides a detailed account of the collaborative structure of the team and the technical design of one functional requirement which are in accord with the modules' lectures and the coursework specification.

APPENDIX II.

Project Management

1. Team Structure

The project team consists of four members. Each member is responsible for one subsystem of the United Student Unions (USU) platform. The structure used is in direct accord with a distributed subsystem responsibility method of ensuring the modularity of development and the subsequent economy of integration processes, being as follows:

- Member A USU Student App (mobile application for students).
- Member B Student Union Management System (web interface for university-specific student unions).
- Member C USU Operation System (federation management subsystem).
- Author Society Leader App (mobile and web interface for society leaders).

The project team agreed to work independently but to carry out weekly meetings in person and to maintain all project documentation in overall common use for the project team via a central GitHub Repository.

2. Group collaboration

The project team arrived at some clearly defined media for collaboration to maintain consistency and equitable clarity. This consisted of:

- A GitHub repository used as the central hub for documentation and artefacts.
- Weekly in-person meetings to coordinate subsystem integration and progress.

- A WhatsApp group for real-time communication.
- Version control practices to ensure traceability and accountability.

3. Meeting Schedule and Minutes

Week	Date	Туре	Topics	Attendance	Time and Place
1	25/09	Kick-off meeting	Team structure, GitHub setup, subsystem allocation	All members	12:00–13:00, AB-115, Headington Campus
3	09/09	Progress meeting	Review case study, discuss quality attributes, integration plan	Two members	12:00–13:00, AB-115, Headington Campus
4	14/10	Planning meeting	Individual progress on Task 1 and 2, coordination for Week 5 delivery	Two members	12:00–13:00, AB-115, Headington Campus

The author participated in the first meeting and reviewed meeting notes from the third via GitHub.

4. Agenda Template

- Attendance check.
- Review of previous actions.
- Subsystem progress updates.
- Blockers and integration concerns.
- Action items and deadlines.

5. Action Tracking Example

Member	Action	Deadline
1	Define use cases and initial quality requirements for Student App subsystem	Week 5
2	Define use cases and quality attributes for Union Management System subsystem	Week 5
3	Define use cases and quality attributes for Operation System subsystem	Week 5
Author	Define use cases and quality attributes for Society Leader App (FR-SL-2: Event Creation)	Week 5
All	Review each other's quality requirement drafts and integrate feedback	Week 5

6. Project Management Approach

The lightweight agile methodology was adopted by the team, integrating short cycles of core team coordination with formal documentation practices. Responsibilities for conformance are unequally balanced by subsystem owners, provided that they can focus on subsystem growth and encompassing integration. The team meets weekly to enable fixing of engaging effort without overloading any team with workload.

APPENDIX III.

Software Quality Requirements

1. Functional Requirement Overview

FR-SL-2: The system shall enable society leaders to create events by providing information on events including the name of the event, theme of the event, details of the organising agent, time and date of the event, location of event, coverage of event promotion and promotion material. The successful creation of an event will denote that the event will be up and promoted to the extent defined in the USU system. The suggested functionality relates to what is believed to be close to student engagement and total system calling into an event. This was analysed in the case study and the relative quality attributes referred to in lecture 2 (Zhu, 2025) sourced from ISO/IEC 25010 (2011).

2. Quality Requirements Specification

a) Security and Privacy Protection

Security and privacy are important aspects of user information gained from user effort and organisational databases. The requirements for this subsystem are considered from the principles outlined in lecture 2, and compatible with ISO/IEC 25010 (2011). Specifically events:

- Events creation activity action should only be performed by bona fide society leaders, and as such comprehensive action on the basis of access control to credentially verified roles should be carried out.
- Data transmission will be harnessed using HTTPS protection on the basis of TLS 1.3.
- Event data will be stored on the basis of storage security assurances with encryption algorithms.
- Systemic action including events nor user information will go unlogged to the extent of total accountability. Auditability will be achieved.

b) Performance

Requirements for performance will lead to delivery of a fast experience from the Society Leader App for users, to the extent that the individual experience is a fast action, particularly meaningful during stressful peak usage periods. The Research guidelines of the lectures will be followed (Lecture 2):

- Request for event creation will have the confirmation returned to the user in the space of 2 seconds provided a normal load of request demands.
- Uploading for promotional material (≤ 10 MB) should occur in the space of 5 seconds.
- Asynchronous processing would be required for non-critical applications to enable user responsiveness.
- Naturally the fluidity of the UI should be available during data transmission of whole numbers.

c) Reliability

Reliability as such suggests that stability of platform and data systems are guaranteed during total event creation. The principles of lecture 2 should be followed:

- The availability of the system in question should be not less than 99.5% during academic periods.
- Total establishment of the event must be on the basis of atomic transaction type by event (the event creation).
- The results of failure will cause rollback of the result and clear notifications of specific fault necessitated.
- Event data will be stored with redundant sources of information and data systems across Cloud Servers.

d) Scalability

Necessary are the methods to ensure growth in kind of utilisation to be gained at more and more universities. Considerations from lecture 1 and 2 are preferable:

- The system should cope accordingly with an abundance of (not more than) 100,000 concurrent society leaders.
- Versions of the systems infrastructure should expand on a horizontal basis to cover peak demand during event creations and tested estimated maximum periods.
- Processes for the calling of events should lead dynamic scalability in kind of audience of considerable range - as worthwhile.
- The extent of cached data should be available from the system to ensure work performed will not lead to lapses in performance outcomes.

3. Summary Table of Quality Requirements

Attribute	Requirement Highlights	Reference	
Security & Privacy	TLS 1.3, encryption, role-based access, logging	Lecture 2; ISO/IEC 25010 (2011)	
Performance	≤ 2 s response, async processing, responsive UI	Lecture 2	
Reliability	99.5 % availability, atomic transactions, error rollback, redundancy	Lecture 2.	
Scalability	Scalability 100 k concurrent users, horizontal scaling, distributed notifications, caching
